TELEPHONE HYBRID manual

The D&R telephone hybrid is intended to be used to create an easy connection between the telephone line and studio equipment.

Connection has to be made between telephone and the telephone line by way of the hybrid.

Connect the two wires of the telephone line to the tip and earth of the line input and connect the telephone itself to the phone output on the tip and earth only. Now the hybrid is interfaced (fully balanced) between your telephone and its connection to the outside world.

The hybrid is now capable of splitting the send and return signals.

Connect the hybrid balanced audio input to a (preferable) balanced output of around +4dBu. This output has to be the mix of all signals except the signal coming from the hybrid itself to avoid feedback

An aux output will do, or in broadcast mixers a modified cleanfeed is the best.

SETTING UP PROCEDURE

Push the "to caller" switch and leave the "connect" switch in the up position
Now dial the caller to whom you want to talk.

If this connection is made you connect the caller to the mixing console by pushing the connect switch.

Now listen by means of a pfl switch to the caller and adjust while talking the C and R balance so that the outgoing signal (your talking) is best damped.

Practically for a start is to put the C balance on number 7 and the R balance on 5. Carefully adjusting afterwards can be realised by slowly adjusting the R balance for optimum damping.

This can be left in this way for most of your calls, because only the line to you own telephone station has to be balanced once.

The damping will be around 22 to 26 dB.

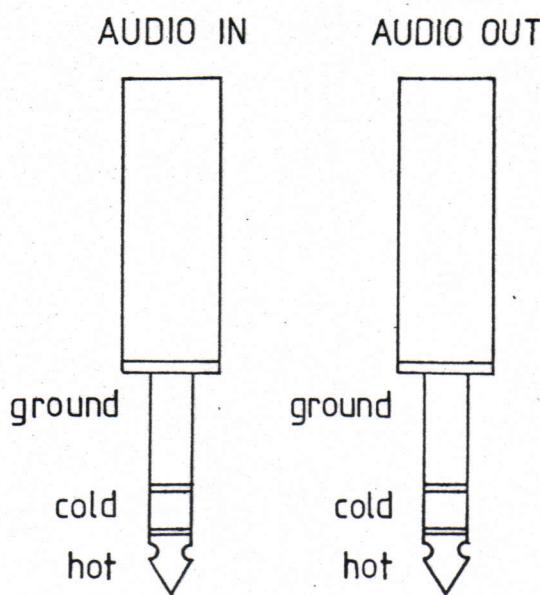

The function of the "connect" switch is to connect the hybrid to the telephone line instead of the phone itself (which is now switched off).

The led indicates that a connection has been made.

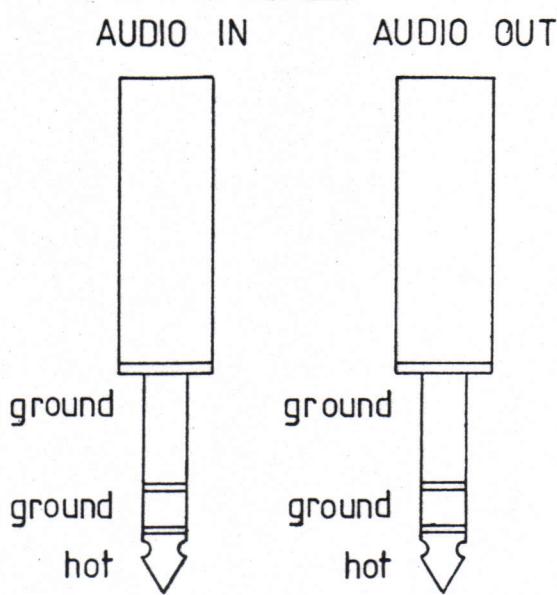

The function "to caller" is there to disconnect the outgoing signal to the caller for private discussions.
