

AIRCAST FREEZES after DATABASE SEARCH

QUESTION:

I have a database MS SQL 2012 with a huge lot of tracks in it and I want to do a search function.

If I do a search function with a single "n" and then hit GO Aircast freezes totally (also after waiting for one hour) is this a bug?

Do you have some tips or workarounds besides not doing this at all?

ANSWER:

It's because there are too many results to be fetched.

A workaround is to specify a minimum number of characters for the search in GUI.ini

so people don't accidently search for a single character:

```
[DatabaseSearch]
```

```
MinChars=3
```
