

BACKUP in AIRCAST

QUESTION:

Also now we should start to understand for how Main and Backup working procedure for Aircast. Do you have any idea to make a system running by which 1 Aircast is running as main and another is hot-backup, I meant when the main Aircast not responding, so the backup machine will take care for playing out the contents with at same playlist and point of playing as the last Payout at main machine?

ANSWER:

There is no automatic sync of studios currently, it's planned for a future version.

If it's 24/7 unattended playback, you can just set up two PCs identically, letting them load and play the same playlists from the database simultaneously, and switch over to #2 when #1 fails.

For live assist, the DJ must resume manually in case of failure.
