

## SQL database questions

**Question:**

For MS SQL server connection, It seemed that we cannot deploy more than one client to MS SQL Server.

In case more than 1 client connect to MS SQL database, the SQL Server said error as attached file. I searching the issue on the web and some guy explain to do following steps to solves, but I don't know the way to do that, please advise me more details to make this:

"To solve this, you have two choices:

- a. Make sure you read the rest data from the pending result set before you send the next SqlCommand.
- b. Use MARS (Multiple Active ResultSet) connection setting to enable multiple active result set in a connection.

**Answer:**

if I recall correctly, this error occurs when "Microsoft SQL Server Native Client" is not installed on the client computer.

The SQL connection will then fall back to the default ODBC driver installed in the Windows system, which cannot handle the database requests correctly.

SQL Server Native Client can be downloaded from here (pick correct Windows version 32/64 bit):

32-bit: <http://go.microsoft.com/fwlink/?LinkID=239647&clcid=0x409>

64-bit: <http://go.microsoft.com/fwlink/?LinkID=239648&clcid=0x409>
